(54) **Bis(aminostyryl) anthracene compound, synthesis intermediate thereof, and process for production thereof**

(57) A bis(aminostyryl)anthracene compound represented by the general formula [I] or the like below.

## General formula [I]

(where R<sup>2</sup> and R<sup>3</sup> each denotes an unsubstituted aryl group; R<sup>1</sup> and R<sup>4</sup> each denotes an aryl group having a specific substituent such as methoxy group; and R<sup>5</sup> and R<sup>6</sup> each denotes a cyano group or the like.)

A process for producing a bis(aminostyryl)anthracene compound represented by the general formula [I] by condensation of, for example, 4-(N,N-diaryl amino)benzaldehyde with diphosphonic ester or diphosphonium.

The bis(aminostyryl)anthracene compound emits intense yellow or red light. The process permits efficient production of the bis(aminostyryl)anthracene compound. The bis(aminostyryl)anthracene compound emits intense yellow or red light. The process permits efficient production of the bis(aminostyryl)anthracene compound.

EP 1 090 911 A2

FIG. 1

## Description

## BACKGROUND OF THE INVENTION

5 [0001] The present invention relates to a bis(aminostyryl)anthracene compound, a synthesis intermediate thereof, and a process for production thereof, the anthracene compound being suitable for use as an organic luminescent material which emits light of desired color.

[0002] Organic electroluminescent elements (EL elements) nowadays are attracting attention as a component suitable for flat panel displays emitting light spontaneously, responding at high speeds, and being independent of viewing  
10 angles. This has aroused attention to organic luminescent materials as a constituent of EL elements. One advantage of organic luminescent materials is that they have desired optical properties according to their molecular design. Therefore, it is possible to produce luminescent materials emitting any of three primary colors (red, blue, and green). Combination of these luminescent materials will realize full-color organic electroluminescent elements.

[0003] A bis(aminostyryl)anthracene compound represented by the general formula [A] below emits intense light of  
15 color from blue to red in the visible region depending on substituents introduced therein. Therefore, it will find use in various applications, not limited to use as a material for organic electroluminescent elements. It is capable of sublimation and hence it offers the advantage of forming a uniform amorphous film by vacuum deposition. At present, it is possible to predict to some extent the optical properties of a material by means of molecular orbital calculations. However, it is most important to develop a process for efficient production of a material necessary for practical use.

## General formula [A]

(where Ar denotes an aryl group which may have a substituent, and  $R^a$  and  $R^b$  may be identical or different, each denoting a hydrogen atom, saturated or unsaturated hydrocarbon group, aryl group which may have a substituent, cyano  
30 group, halogen atom, nitro group, or alkoxy group.)

[0004] A large number of compounds represented by the general formula [A] have been produced so far as the organic luminescent material. Most of them emit light of blue to green, and a few of them emitting yellow to red light have been reported. [Institute of Electric Information and Communication, Report on Technical Researches, Organic Electronics, 17, 7 (1992); Inorganic and Organic Electroluminescence 96 Berlin, 101 (1996); etc.] Any process for their efficient  
35 production has never been established.

## SUMMARY OF THE INVENTION

[0005] The present invention was completed in view of the foregoing. It is an object of the present invention to provide a compound which is suitable as an organic luminescent material to emit intense light of yellow to red color, a synthesis intermediate thereof, and a process for efficient production thereof.

## DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0007] The present inventors carried out extensive studies to solve the above-mentioned problems. As the result, it was found that a bis(aminostyryl)anthracene compound represented by the general formula [I], [II], [III], or [IV] below emits intense light and hence can be used as a luminescent material for yellow to red colors. In addition, the present inventors established a process for its efficient production. These findings led to the present invention.

[0008] First, the present invention is directed to a bis(aminostyryl)anthracene compound represented by the general formula [I], [II], [III], or [IV] below. This compound will be referred to as "the compound of the present invention" hereinafter.

### General formula [I]

(where R<sup>2</sup> and R<sup>3</sup> each denotes an unsubstituted aryl group, and R<sup>1</sup> and R<sup>4</sup> each denotes an aryl group represented by the general formula (1) below.)

### General formula (1)

(where R<sup>7</sup>, R<sup>8</sup>, R<sup>9</sup>, R<sup>10</sup>, and R<sup>11</sup> are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having at least one carbon; and R<sup>5</sup> and R<sup>6</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom (such as F, Cl, Br, and I.) [The definition of halogen atom shall be applied hereinafter.]

## General formula [II]

(where R<sup>12</sup>, R<sup>13</sup>, R<sup>14</sup>, and R<sup>15</sup> are identical or different groups, each denoting an aryl group represented by the general formula (2) below.)

## General formula (2)

(where R<sup>18</sup>, R<sup>19</sup>, R<sup>20</sup>, R<sup>21</sup>, and R<sup>22</sup> are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having at least one carbon; and R<sup>16</sup> and R<sup>17</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

## General formula [III]

(where at least one of R<sup>23</sup>, R<sup>24</sup>, R<sup>25</sup>, and R<sup>26</sup> denotes an aryl group represented by the general formula (3) below, with the remainder being an unsubstituted aryl group.)

## General formula (3)

(where R<sup>29</sup>, R<sup>30</sup>, R<sup>31</sup>, R<sup>32</sup>, and R<sup>33</sup> are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon amino group; and R<sup>27</sup> and R<sup>28</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

## General formula [IV]

(where R<sup>35</sup> and R<sup>36</sup> are identical or different groups, each denoting an aryl group represented by the general formula (4) below.)

## General formula (4)

(where R<sup>40</sup>, R<sup>41</sup>, R<sup>42</sup>, R<sup>43</sup>, and R<sup>44</sup> are identical or different groups, each denoting hydrogen or at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having at least one carbon; and R<sup>34</sup> and R<sup>37</sup> are identical or different groups, at least one of them being an aryl group represented by the general formula (5) below.)

## General formula (5)

(where R<sup>45</sup>, R<sup>46</sup>, R<sup>47</sup>, R<sup>48</sup>, R<sup>49</sup>, R<sup>50</sup>, and R<sup>51</sup> are identical or different groups, each denoting a hydrogen atom or at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having at least one carbon; and R<sup>38</sup> and R<sup>39</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

**[0009]** The compound of the present invention can be effectively used as an organic luminescent material which emits light ranging from yellow to red in color. In addition, it has a high glass transition point and a high melting point. It is electrically, thermally, and chemically stable. It readily assumes an amorphous glass state and hence it permits vapor deposition.

**[0010]** The compound of the present invention should preferably be one which is represented by the general formula (6) below.

## General formula (6)

(where Ar<sup>1</sup>, Ar<sup>2</sup>, Ar<sup>3</sup>, and Ar<sup>4</sup> are identical or different, each denoting an aryl group which may have a substituent, and if a substituent is present, the aryl group being one which is selected from aryl groups represented by the general formula (7), (8), (9), (10), (11), (12), (12'), or (12'') below.

30 [0020] The present invention is directed also to a process for efficiently producing the compound of the present invention. This process yields a bis(aminostyryl)anthracene compound represented by the general formula [I], [II], [III], or [IV] given above by condensation from at least one species of 4-(N,N-diarylamino)benzaldehyde represented by the general formula [V] or [VI] below and diphosphonic ester represented by the general formula [VII] below or diphosphonium represented by the general formula [VIII] below.

35

**General formula [V]**

45

**General formula [VI]**

55 (where R<sup>66</sup> and R<sup>67</sup> each denotes an aryl group corresponding to R<sup>1</sup>, R<sup>2</sup>, R<sup>12</sup>, R<sup>13</sup>, R<sup>23</sup>, R<sup>24</sup>, R<sup>34</sup>, or R<sup>35</sup> given above; and R<sup>68</sup> and R<sup>69</sup> each denotes an aryl group corresponding to R<sup>3</sup>, R<sup>4</sup>, R<sup>14</sup>, R<sup>15</sup>, R<sup>25</sup>, R<sup>26</sup>, R<sup>36</sup>, or R<sup>37</sup> given above.)

[0021] The process for producing the compound of the present invention consists of treating the diposphonic ester or diposphonium with a base in a solvent, thereby giving carboanion, and condensing this carboanion with the 4-(N,N-diarylamino)benzaldehyde by Wittig-Horner reaction or Wittig reaction.

[0022] For example, a bis(aminostyryl)anthracene compound represented by the general formula (6) below

## General formula (6)

(where  $Ar^1$ ,  $Ar^2$ ,  $Ar^3$ , and  $Ar^4$  are defined as above.) is produced by condensing at least one species of 4-(N,N-diarylamino)benzaldehyde represented by the general formula (33) or (34) below with diposphonic ester represented by the general formula (35) below or diposphonium represented by the general formula (36) below.

General formula (33)

General formula (34)

General formula (35)

General formula (36)

(where Ar<sup>1</sup>, Ar<sup>2</sup>, Ar<sup>3</sup>, Ar<sup>4</sup>, R<sup>70</sup>, R<sup>71</sup> and X are defined as above.)

[0023] This reaction may be shown by the following reaction scheme 1.

## Reaction scheme 1:

35 [0024] This reaction is started by treating the compound of the general formula (35) or (36) with a base in a solvent, thereby giving carboanion, and is completed by condensing this carboanion with the aldehyde of the general formula (33). Possible combinations of a base and a solvent are as follows.

40 [0025] Sodium hydroxide/water, sodium carbonate/water, potassium carbonate/water, sodium ethoxide/ethanol or dimethylformamide, sodium methoxide/methanol-diethyl ether mixed solvent or dimethylformamide, triethylamine/ethanol or diglyme or chloroform or nitromethane, pyridine/methylene chloride or nitromethane, 1,5-diazabicyclo[4.3.0]non-5-ene/ dimethylsulfoxide, potassium t-butoxide/dimethylsulfoxide or tetrahydrofuran or benzene or dimethylformamide, phenyl lithium/diethyl ether or tetrahydrofuran, t-butyl lithium/ diethyl ether or tetrahydrofuran, sodium amide/ammonium, sodium hydride/dimethyl formamide or tetrahydrofuran, trimethyl sodium/diethyl ether or tetrahydrofuran, etc.

45 [0026] This reaction proceeds at a comparatively low temperature (-30°C to 30°C) and proceeds selectively. Therefore, the desired product can be purified easily by chromatography. In addition, the compound of the present invention represented by the general formula (6) is highly crystalline and hence it can be purified easily by recrystallization. The method of recrystallization is not specifically restricted. A simple way is by dissolution in acetone and subsequent addition of hexane, or by dissolution in toluene with heating and subsequent concentration and cooling. This reaction may be carried out under normal pressure for 3-24 hours.

50 [0027] The process of the present invention yields a bis(aminostyryl)anthracene compound represented by the general formula (13), (13'), (14), (15), (16), (17), (17'), (17''), (20), (21), (22), (23), (24), (24'), (24''), (27), (28), (29), (30), or (31) given above. To be more specific, the process of the present invention yields a bis(aminostyryl)anthracene compound represented by the structural formula (18)-1, (18)-2, (18)-2', (18)-3, (18)-4, (18)-5, (18)-6, (18)-7, (18)-8, (18)-9, (18)-10, (18)-10', (18)-10'', (18)-11, (25)-1, (25)-2, (25)-2', (25)-3, (25)-4, (25)-5, (25)-6, (25)-7, (25)-8, (25)-9, (25)-10, (25)-10', (25)-10'', (25)-11, (32)-1, (32)-2, (32)-2', (32)-3, (32)-4, (32)-5, (32)-6, (32)-7, (32)-8, (32)-9, (32)-10, (32)-10', or (32)-10'' given above.

55 [0028] The present invention also provides a variety of compounds suitable as intermediates for synthesis of the compound of the present invention.

[0029] The intermediate is diphosphonic ester represented by the general formula [VII] above or diphosphonium represented by the general formula [VIII] above. It is used for synthesis of a bis(aminostyryl)anthracene compound represented by the general formula [I], [II], [III], or [IV] above.

[0030] To be concrete, this synthesis intermediate (referred to as the synthesis intermediate 1 of the present invention) is represented by the general formula (35), (36), (37), (38), (39), or (40) below.

#### General formula (38)

## General formula (39)

## General formula (40)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and X are defined as above.)

[0031] The synthesis intermediate 1 of the present invention may be derived from its precursor as follows.

[0032] That is, reaction between an aryl halide compound represented by the general formula [IX] and a trialkyl phosphite represented by the general formula [X] or triphenyl phosphine ( $\text{PPh}_3$ ) yields diphosphonic ester represented by the general formula [VII] above or diphosphonium represented by the general formula [VIII] above as the synthesis intermediate. This reaction may be carried out without solvent or in a solvent (such as xylene) having a boiling point higher than  $120^\circ\text{C}$ . This reaction may also be carried out in a large excess of trialkyl phosphite under normal pressure at  $120\text{--}160^\circ\text{C}$  for 30 minutes to 24 hours.

## General formula [IX]

(where  $\text{R}^{72}$  and  $\text{R}^{73}$  are identical or different, at least one of them denoting a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom, and X denotes a halogen atom.)

General formula [X]

(where  $\text{R}^{74}$  and  $\text{R}^{75}$  are identical or different, each denoting a hydrocarbon group, particularly a saturated or unsaturated hydrocarbon group having 1 to 4 carbon atoms.)

[0033] The present invention also provides an aryl halide compound (referred to as the synthesis intermediate 2 of the present invention) represented by the general formula [IX] above, which is used as a synthesis intermediate to give the synthesis intermediate 1 of the present invention.

[0034] The synthesis intermediate 2 of the present invention can be obtained by reaction with irradiation between a dimethylantracene compound represented by the general formula [XI] below and an N-halogenated succinimide represented by the general formula [XII] below. This reaction is carried out in a solvent such as carbon tetrachloride, chloroform, benzene, and chlorobenzene. The light source for irradiation includes a high-pressure mercury lamp, low-pressure mercury lamp, xenon lamp, halogen lamp, sun light, and fluorescent lamp. The reaction may be carried out under normal pressure at  $20\text{--}120^\circ\text{C}$  for 30 minutes to 48 hours.

## General formula [XI]

(where  $R^{72}$  and  $R^{73}$  are identical or different, at least one of them denoting a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

## General formula [XII]

(where X denotes a halogen atom.)

[0035] The above-mentioned reaction to give the synthesis intermediates 1 and 2 may be represented by the reaction scheme 2 as follows.

## Reaction scheme 2:

[0036] Figs. 11 to 14 show some examples of the organic electroluminescent element (EL element) which employs the compound of the present invention as an organic luminescent material.

[0037] Fig. 11 shows an organic electroluminescent element A of transmission type which is designed such that the cathode 3 transmits the emitted light 20 or the emitted light 20 is visible through the protective film 4. Fig. 12 shows an organic electroluminescent element B which is designed such that the cathode 3 reflects the emitted light 20.

[0038] In Figs. 11 and 12, the reference number 1 indicates a substrate on which is formed the organic electroluminescent element. The substrate may be formed from glass, plastics, and any other adequate material. In the case where the organic electroluminescent element is used in combination with other display element, a single substrate may be used in common for both of them. The reference number 2 denotes a transparent electrode (anode), which is made from ITO (Indium tin oxide) or  $\text{SnO}_2$ .

[0039] The reference number 5 denotes an organic luminescent layer which contains the compound of the present invention as the luminescent material. The luminescent layer may have any known layer structure for obtaining the emitted light 20. For example, it may be formed from thin films of hole transfer layer and electron transfer layer. One or both of these layers may be combined with other thin films or mixed with other materials so as to improve the charge transfer performance. In addition, in order to improve the light-emitting performance, a thin film made of one or more fluorescent materials may be interposed between the hole transfer layer and the electron transfer layer. Alternatively, one or more fluorescent materials may be incorporated into the hole transfer layer or the electron transfer layer or both. In this case, the layer structure may include a thin film to control the hole transfer or electron transfer so as to improve the light-emitting efficiency.

[0040] If the compound of the present invention has both functions of electron transfer and hole transfer, then it may be used as the light-emitting layer which also functions as the electron transfer layer or it may be used as the light emitting-layer which also functions as the hole transfer layer. Another possible structure is such that the compound of the present invention constitutes the light-emitting layer which is interposed between the electron transfer layer and the hole transfer layer.

[0041] Incidentally, the reference number 3 in Figs. 11 and 12 indicates a cathode, which is made of an active metal (such as Li, Mg, and Ca) and a metal (such as Ag, Al, and In) in the form of alloy or laminate. In the case of an organic electroluminescent element of transmission type, the cathode thickness may be properly adjusted so that the cathode has an adequate light transmittance suitable for individual applications. The reference number 4 in Figs. 11 and 12 indicates a sealing/protective layer which entirely covers the organic electroluminescent element for the maximal effect. An adequate material may be used to ensure hermetic sealing. The reference number 8 denotes a power supply to drive the element.

[0042] The organic luminescent element mentioned above has an organic layer in which the hole transfer layer and the electron transfer layer are laminated on top of the other. In other words, it has the single-hetero structure. The hole transfer layer or the electron transfer layer may be formed from the compound of the present invention. Alternatively, the organic layer may have the double-hetero structure in which the hole transfer layer, the luminescent layer, and the electron transfer layer are laminated sequentially. In this case, the luminescent layer may be formed from the compound of the present invention.

[0043] Fig. 13 shows an organic electroluminescent element C of single-hetero structure (organic laminate structure). This organic electroluminescent element is composed of a transparent substrate 1, a transparent anode 2, an organic layer 5a (consisting of a hole transfer layer 6 and an electron transfer layer 7), and a cathode 3, which are sequentially laminated one over another. The layer structure is sealed with a protective film 4.

[0044] The layer structure shown in Fig. 13 has no luminescent element. In this case, light 20 of desired wavelength is emitted from the interface between the hole transfer layer 6 and the electron transfer layer 7. The emitted light is visible through the substrate 1.

[0045] Fig. 14 shows an organic electroluminescent element D of double-hetero structure. This organic electroluminescent element is composed of a transparent substrate 1, a transparent anode 2, an organic layer 5b (consisting of a hole transfer layer 10, a luminescent layer 11, and an electron transfer layer 12), and a cathode 3, which are sequentially laminated one over another. The layer structure is sealed with a protective film 4.

[0046] The organic electroluminescent element shown in Fig. 14 is given dc current applied across the anode 2 and the cathode 3. This dc current causes anode 2 to inject holes and the cathode 3 to inject electrons. The injected holes reach the luminescent layer 11 through the hole transfer layer 10 and the injected electrons reach the luminescent layer 11 through the electron transfer layer 12. The electron/hole recombination takes place in the luminescent layer 11, thereby giving rise to singlet excitons which emit the light of desired wavelength.

[0047] In the above-mentioned organic electroluminescent elements C and D, the substrate 1 may be formed from any transparent material such as glass and plastics. This substrate may serve for another display element combined with the electroluminescent element. This substrate may also serve for the electroluminescent elements of laminate structure (as shown in Figs. 13 and 14) which are arranged in array. The elements C and D may be of transmission type or reflection type.

**[0048]** The anode 2 is a transparent electrode made of ITO (indium tin oxide) or  $\text{SnO}_2$ . Adjoining the anode 2 is the hole transfer layer 6 (or 10). There may be interposed between them a thin film of organic compound or organo-metallic compound for improvement in charge injection efficiency. In the case where the protective film 4 is made of electrically-conductive material (such as metal), the anode 2 may have an insulating layer on its sides.

**[0049]** The organic electroluminescent element C has an organic layer 5a of laminate structure which is composed of a hole transfer layer 6 and an electron transfer layer 7. Either or both of these layers contain the compound of the present invention mentioned above so that they emit light. The organic electroluminescent element D has an organic layer 5b of laminate structure which is composed of a hole transfer layer 10, a light-emitting layer 11 (containing the compound of the present invention), and an electron transfer layer 12. The laminate structure may be modified variously. For example, either or both of the hole transfer layer and the electron transfer layer may possess the light-emitting layer.

**[0050]** It is desirable that the hole transfer layer 6 or the electron transfer layer 7 or the light-emitting layer 11 is made entirely of the compound of the present invention. Alternatively, they may be formed from the compound of the present invention and a hole or electron transfer material (such as aromatic amine and pyrazoline) which undergo vapor deposition simultaneously. The hole transfer layer may be composed of several hole transfer layers of different kind so that it has improved hole transfer performance.

**[0051]** The organic electroluminescent element C permits the electron transfer layer 7 to emit light; however, it may also permit the hole transfer layer 6 (or its interface) to emit light depending on the voltage applied by the power supply 8. Likewise, the organic electroluminescent element D permits the electron transfer layer 12 or the hole transfer layer 10 as well as the light-emitting layer 11 to emit light. For their improved light-emitting performance, these electroluminescent elements should preferably be of such structure that the light-emitting layer 11 (which contains at least one kind of fluorescent material) is interposed between the hole transfer layer 10 and the electron transfer layer 12. Alternatively, they may be of such structure that the fluorescent material is contained in the hole transfer layer or the electron transfer layer or both. For improved light-emitting efficiency in these cases, the electroluminescent element may have a thin layer (hole blocking layer or exciton generating layer) to control the transfer of holes or electrons.

**[0052]** The cathode 3 may be formed from an alloy of active metal (such as Li, Mg, and Ca) and metal (such as Ag, Al, and In). Alternatively, it may be a laminate of these metals in the form of thin film. The cathode may vary in thickness and material according to the intended use of the electroluminescent element.

**[0053]** The protective layer 4 functions as a sealing film. It should entirely cover the organic electroluminescent element for improvement in electron injection efficiency and light-emitting efficiency. It may be formed from any material (such as aluminum, gold, and chromium in the form of metal or alloy) so long as it provides hermetic seal.

**[0054]** The above-mentioned organic electroluminescent elements are usually given direct current. However, they may also be given pulsating current or alternating current. The magnitude of current and voltage is not specifically restricted so long as it is not large enough to destroy the element. Efficient light emission with minimal electric energy is desirable in view of the power consumption and life of the organic electroluminescent elements.

**[0055]** Fig. 15 is a schematic diagram showing the structure of a flat display composed of the organic electroluminescent elements. In the case of full-color display, there is interposed between the cathode 3 and the anode 2 an organic layer 5 (5a, 5b) which emits three primary colors -- red (R), green (G), and blue (B). The cathodes 3 and the anodes 2 are arranged at right angles each other. They are connected to the luminance signal circuit 14 and the control circuit 15 containing shift registers, so that they select a specific pixel at the intersection of the cathode 3 and the anode 2 and apply a signal voltage to it to make the organic layer to emit light.

**[0056]** The display shown in Fig. 15 is that of simple matrix type ( $8 \times 3$  RGB). It has a laminate 5 interposed between the cathode 3 and the anode 2. This laminate is composed of at least one of the hole transfer layer, light-emitting layer, and electron transfer layer. (See Figs. 13 and 14.) The cathodes and anodes are patterned in strips and crossed each other at right angles so that they form a matrix. They are given signal voltage sequentially by the control circuits 15 and 14 containing shift registers, so that they emit light at their intersection. EL elements constructed in this way can be used as a display for characters and codes. They can also be used as an image-reproducing unit. In addition, they may form a solid-state multicolor or full-color flat panel display if each pattern consisting of cathodes and anodes is arranged individually for red, green, and blue colors.

**[0057]** The invention will be described in more detail with reference to the following examples, which are not intended to restrict the scope thereof.

## Example 1

(Synthesis of bis(aminostyryl)anthracene compound represented by the structural formula (18)-2)

5 [0058]

[0059] In a reactor was placed 13.1 mmol of sodium hydride (in mineral oil). It was suspended in 10 mL of anhydrous tetrahydrofuran (THF) under a nitrogen atmosphere. With stirring at room temperature, the reactor was given dropwise 120 mL of solution containing 2.19 mmol of diphosphonic ester (represented by the structural formula (35)-1) in 1:1 mixed solvent of anhydrous tetrahydrofuran and anhydrous dimethylformamide. The reactor was further given 30 mL of solution in anhydrous tetrahydrofuran of 4-[N-phenyl-N-(4-methoxyphenyl)amino]benzaldehyde (represented by the structural formula (33)-1). The reactants were stirred for 7 hours. The reaction solution was quenched with a small amount of ice, washed with saturated aqueous solution of sodium chloride, and dried with anhydrous sodium sulfate.

[0060] The reaction product was purified by silica gel chromatography (WAKO-gel C-300, tetrahydrofuran:hexane = 1:8) and then recrystallized from acetone-hexane mixed solvent. Thus there was obtained the desired bis(aminostyryl)anthracene compound (represented by the structural formula (18)-2) in the form of red crystals. (0.257 g)

[0061] This compound was identified by <sup>1</sup>HNMR and FAB-MS. (14% yields)

45 <sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)

3.83(6H,s), 6.87(4H,d), 6.90(4H,m), 7.12(8H,d), 7.18-7.39(4H,m), 7.45(4H,d), 8.04(2H,d), 8.32(4H,s), 8.40(2H,d).

This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 1. (TSM in the spectrum indicates the peak due to trimethylsilane as the reference substance added at the time of measurement. The same shall apply hereinafter.) This compound has a glass transition point of 150°C and a melting point of 321°C.

[0062] This compound gives a toluene solution which has the maximum visible absorption at 566 nm and the fluorescence maximum wavelength at 645 nm.

55

**Example 2**

(Synthesis of bis(aminostyryl)anthracene compound represented by the structural formula (18)-6')

**[0063]**

**[0064]** In a reactor was placed 3.75 mmol of sodium hydride (in mineral oil). It was suspended in 10 mL of anhydrous tetrahydrofuran (THF) under a nitrogen atmosphere. With stirring at room temperature, the reactor was given dropwise 80 mL of solution containing 0.734 mmol of diphosphonic ester (represented by the structural formula (35)-1) and 0.579 g (1.55 mmol) of 4-[N,N-dinaphthylamino]benzaldehyde (represented by the structural formula (33)-2) in 3:1 mixed solvent of anhydrous tetrahydrofuran and anhydrous dimethylformamide. The reactants were stirred for 12 hours. The reaction liquid was quenched with a small amount of ice, washed with saturated aqueous solution of sodium chloride, and dried with anhydrous sodium sulfate.

**[0065]** The reaction product was purified by silica gel chromatography (WAKO-gel C-300, toluene) and then recrystallized from toluene. Thus there was obtained the desired bis(aminostyryl)anthracene compound (represented by the structural formula (18)-6') in the form of red crystals (0.419 g).

**[0066]** This compound was identified by  $^1\text{H}$ NMR and FAB-MS. (59% yields)

$^1\text{H}$ NMR ( $\text{CDCl}_3$ )  $\delta$  (ppm)

6.68(4H,d), 7.12(d,2H), 7.26-7.42(22H,m), 7.48(4H,t), 7.73(4H,d), 7.89(4H,d), 7.96(2H,d), 8.05(4H,d), 8.24(2H,s), 8.33(2H,d)

This compound gave a  $^1\text{H}$ NMR spectrum as shown in Fig. 2. This compound has a glass transition point of 214°C and a melting point of 255°C.

**[0067]** This compound gives a toluene solution which has the maximum visible absorption at 566 nm and the fluorescence maximum wavelength at 615 nm.

## Example 3

(Synthesis of bis(aminostyryl)anthracene compound represented by the structural formula (25)-2)

5 [0068]

[0069] In a reactor was placed 10.0 mmol of sodium hydride (in mineral oil). It was suspended in 10 mL of anhydrous tetrahydrofuran (THF) under a nitrogen atmosphere. With stirring at room temperature, the reactor was given dropwise 20 mL of solution containing 1.10 mmol of diphosphonic ester (represented by the structural formula (37)-1) in anhydrous tetrahydrofuran. Stirring was continued for 1 hour. The reactor was further given dropwise 20 mL of solution containing 0.600 g (2.64 mmol) of 4-[N-phenyl-N-(4-methoxyphenyl)amino]benzaldehyde (represented by the structural formula (33)-1) in anhydrous tetrahydrofuran. The reactants were stirred for 24 hours. The reaction solution was quenched with a small amount of ice, washed with saturated aqueous solution of sodium chloride, and dried with anhydrous sodium sulfate.

[0070] The reaction product was purified by silica gel chromatography (WAKO-gel C-300, tetrahydrofuran:hexane = 2:3) and then recrystallized from acetone-hexane. Thus there was obtained the desired bis(aminostyryl)anthracene compound (represented by the structural formula (25)-2) in the form of red crystals (0.228 g).

[0071] This compound was identified by <sup>1</sup>HNMR and FAB-MS. (26% yields)

45 <sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)  
3.83(6H,s), 6.87(4H,d), 7.03(6H,m), 7.14(8H,d), 7.18-7.35(2H,d), 7.44(4H,m), 7.83(1H,d), 7.95-8.01(3H,m), 8.28(1H,s), 8.33(1H,d), 8.51(1H,s)

50 This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 3. This compound has a glass transition point of 124°C and a melting point of 215°C.

[0072] This compound gives a toluene solution which has the maximum visible absorption at 490 nm and the fluorescence maximum wavelength at 610 nm.

55

**Example 4**

(Synthesis of bis(aminostyryl)anthracene compound represented by the structural formula (32)-1)

[0073]

[0074] The same procedure as in Example 1 (represented by the structural formula (18)-2) was repeated to give the desired bis(aminostyryl)anthracene compound (represented by the structural formula (32)-1).

[0075] This compound was identified by <sup>1</sup>HNMR and FAB-MS. (14% yields)

<sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)  
6.99(2H,d), 7.04-7.31(10H,m), 7.45(4H,d), 7.73(2H,d), 7.91(2H,s), 7.94(2H,d), 8.30(2H,s)

This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 4.

[0076] This compound gives a toluene solution which has the maximum visible absorption at 443 nm and the fluorescence maximum wavelength at 500 nm.

## Example 5

(Synthesis of bis(aminostyryl)anthracene compound represented by the structural formula (18)-11)

[0077]

[0078] In a reactor was placed 8.24 mmol of sodium hydride (in mineral oil). It was suspended in 20 mL of anhydrous tetrahydrofuran (THF) under a nitrogen atmosphere. With stirring at room temperature, the reactor was given dropwise 50 mL of solution containing 0.824 mmol of diphosphonic ester (represented by the structural formula [VII]-1) in anhydrous tetrahydrofuran. Stirring was continued for 30 minutes. The reactor was further given dropwise 20 mL of solution containing 0.668 g (2.32 mmol) of 4-[N-phenyl-N-(4-tolyl)amino]benzaldehyde (represented by the structural formula (33)-4) in anhydrous tetrahydrofuran. The reactants were stirred at 50°C for 40 hours. The reaction solution was quenched with a small amount of ice, washed with saturated aqueous solution of sodium chloride, and dried with anhydrous sodium sulfate.

[0079] The reaction product was purified by silica gel chromatography (WAKO-gel C-300, tetrahydrofuran:hexane = 1:2) and then recrystallized from acetone-hexane. Thus there was obtained the desired bis(aminostyryl)anthracene compound (represented by the structural formula (18)-11) in the form of red brown crystals (0.174 g).

[0080] This compound was identified by <sup>1</sup>HNMR and FAB-MS. (23% yields)

<sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)

2.35(6H,s), 7.02-7.15(16H,m), 7.25(2H,d), 7.46(4H,d), 7.89(2H,d), 8.43(2H,s), 8.53(2H,d)

This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 5. This compound gives a toluene solution which has the maximum visible absorption at 478 nm and the fluorescence maximum wavelength at 575 nm.

Example 6

(Synthesis of diphosphonic ester represented by the structural formula (35)-1)

[0081]

[0082] In 150 mL of xylene was suspended 0.854 g (2.06 mmol) of 2,6-di(bromomethyl)anthracene-9,10-dicarbonitrile (represented by the structural formula [IX]-1). To the suspension was added dropwise 5.00 g (20.0 mmol) of triethyl phosphite (represented by the structural formula [X]-1). The reactants were stirred at 125°C for 15 hours.

[0083] The reaction solution was cooled to room temperature. With 100 mL of hexane added, the solution was allowed to stand for precipitation. The precipitates were filtered off and washed repeatedly with hexane. Thus there was obtained the desired diphosphonic ester (represented by the structural formula (35)-1) in the form of yellow crystals (1.03 g).

[0084] This compound was identified by <sup>1</sup>HNMR and FAB-MS. (78% yields)

<sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)

1.29(12H,t), 3.45(4H,d), 4.11(8H,q), 7.82(2H,d), 8.36(2H,s), 8.46(2H,d)

This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 6.

Example 7

(Synthesis of diphosphonic ester represented by the structural formula (37-1))

5 [0085]

25 [0086] In 10 mL of xylene was suspended 0.428 g (1.10 mmol) of 2,6-di(bromomethyl)anthracene-9-carbonitrile (represented by the structural formula [IX]-2). To the suspension was added dropwise 0.870 g (5.24 mmol) of triethyl phosphite (represented by the structural formula [X]-1). The reactants were stirred at 125°C for 5 hours.

[0087] The reaction solution was cooled to room temperature. With 10 mL of hexane added, the solution was allowed to stand for precipitation. The precipitates were filtered off and washed repeatedly with hexane. Thus there was obtained the desired diphosphonic ester (represented by the structural formula (37)-1) in the form of yellow crystals.

30 [0088] This compound was identified by <sup>1</sup>HNMR and FAB-MS. (99% yields)

<sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)

1.27(12H,m), 3.40(4H,m), 4.07(8H,m), 7.61(1H,d), 7.68(1H,d), 7.99-8.06(2H,m), 8.26(1H,s), 8.37(1H,d), 8.61(1H,s)

35 This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 7.

40

45

50

55

Example 8

(Synthesis of diphosphonic ester represented by the structural formula [VII]-1)

[0089]

[0090] In 25 mL of xylene was suspended 0.430 mg (0.824 mmol) of 2,6-di(bromomethyl)-9,10-dibromoanthracene (represented by the structural formula [IX]-3). To the suspension was added dropwise 1.45 g (8.75 mmol) of triethyl phosphite (represented by the structural formula [X]-1). The reactants were stirred at 125°C for 10 hours.

[0091] The reaction solution was cooled to room temperature. With 10 mL of hexane added, the solution was allowed to stand for precipitation. The precipitates were filtered off and washed repeatedly with hexane. Thus there was obtained the desired diphosphonic ester (represented by the structural formula [VII]-1) in the form of yellow crystals.

[0092] This compound was identified by  $^1\text{H}$ NMR and FAB-MS. (99% yields)

$^1\text{H}$ NMR ( $\text{CDCl}_3$ )  $\delta$  (ppm)

1.29(12H,t), 3.43(4H,d), 4.08(8H,q), 7.61(2H,d), 8.45(2H,s), 8.53(2H,d)

This compound gave a  $^1\text{H}$ NMR spectrum as shown in Fig. 8.

## Example 9

(Synthesis of 2,6-di(bromomethyl)anthracene-9,10-dicarbonitrile represented by the structural formula [IX]-1)

5 [0093]

25 [0094] In 400 mL of chloroform was dissolved 1.50 g (5.85 mmol) of 2,6-dimethylantracene-9,10-dicarbonitrile (represented by the structural formula [XI]-1). With its atmosphere replaced with nitrogen, the reactor was given 18.0 g (101 mmol) of N-bromosuccinimide (represented by the structural formula [XII]-1) under reflux by portions (6 times at intervals of 12 hours).

30 [0095] The reaction solution was concentrated and the concentrate was purified by alumina chromatography (activated alumina, 300 mesh, chloroform). The resulting precipitates were filtered off and washed repeatedly with hexane. Thus there was obtained the desired 2,6-di(bromomethyl)anthracene-9,10-dicarbonitrile (represented by the structural formula [IX]-1) in the form of yellow crystals (1.76 g).

[0096] This compound was identified by  $^1\text{H}$ NMR and FAB-MS. (73% yields)

35  $^1\text{H}$ NMR ( $\text{CDCl}_3$ )  $\delta$  (ppm)  
4.73(4H,s), 7.90(2H,d), 8.45-8.53(4H,m)

This compound gave a  $^1\text{H}$ NMR spectrum as shown in Fig. 9.

40

45

50

55

**Example 10**

(Synthesis of 2,6-di(bromomethyl)anthracene-9-carbonitrile represented by the structural formula [IX]-2)

**[0097]**

**[0098]** In 100 mL of chloroform was dissolved 0.650 g (2.81 mmol) of 2,6-dimethylantracene-9-carbonitrile (represented by the structural formula [XI]-2). With its atmosphere replaced with nitrogen, the reactor was given 7.50 g (42.2 mmol) of N-bromosuccinimide (represented by the structural formula [XII]-1) under reflux by portions (6 times at intervals of 12 hours).

**[0099]** The reaction solution was concentrated and the concentrate was purified by silica gel chromatography (WAKO-gel, C-300, tetrahydrofuran:hexane = 1:4). The resulting precipitates were filtered off and washed repeatedly with hexane and recrystallized from toluene. Thus there was obtained the desired 2,6-di(bromomethyl)anthracene-9-carbonitrile (represented by the structural formula [IX]-2) in the form of yellow crystals (0.470 g).

**[0100]** This compound was identified by <sup>1</sup>HNMR and FAB-MS. (43% yields)

<sup>1</sup>HNMR (CDCl<sub>3</sub>) δ (ppm)

4.70(2H,s), 7.64(1H,d), 7.75(1H,d), 8.05-8.10(2H,m), 8.38-8.44(2H,m), 8.63(1H,m)

This compound gave a <sup>1</sup>HNMR spectrum as shown in Fig. 10.

**Example 11**

(Synthesis of 2,6-di(bromomethyl)anthracene represented by the structural formula [IX]-3)

**[0101]**

[0102] In 100 mL of chloroform was dissolved 0.500 g (2.42 mmol) of 2,6-dimethylantracene (represented by the structural formula [XI]-3). With its atmosphere replaced with nitrogen, the reactor was given 6.45 g (36.3 mmol) of N-bromosuccinimide (represented by the structural formula [XII]-1) under reflux by portions (twice at intervals of 24 hours).

[0103] The reaction solution was concentrated and the resulting precipitates were filtered off and washed repeatedly with hexane and recrystallized from tetrahydrofuran. Thus there was obtained the desired 2,6-di(bromomethyl)anthracene in the form of yellow crystals (0.430 g).

[0104] This compound was identified by  $^1\text{H}$ NMR and FAB-MS. (34% yields)

[0105] The compound of the present invention emits intense yellow to red light depending on the substituent groups introduced therein. Therefore, it is useful as an organic light-emitting material. It has a high glass transition point and a high melting point, so that it is superior in heat resistance and in electrical, thermal, and chemical stability. It can be readily made into an amorphous glass state. It is sublimable and hence can be formed into a uniform amorphous film by vacuum deposition. It can be produced efficiently by common process via a synthesis intermediate.

# Claims

1. A bis(aminostyryl)anthracene compound represented by the general formula [I], [II], [III], or [IV] below.

## General formula [I]

(where  $R^2$  and  $R^3$  each denotes an unsubstituted aryl group, and  $R^1$  and  $R^4$  each denotes an aryl group represented by the general formula (1) below.)

## General formula (1)

(where  $R^7$ ,  $R^8$ ,  $R^9$ ,  $R^{10}$ , and  $R^{11}$  are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having at least one carbon; and  $R^5$  and  $R^6$  are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

## General formula [II]

(where  $R^{12}$ ,  $R^{13}$ ,  $R^{14}$ , and  $R^{15}$  are identical or different groups, each denoting an aryl group represented by the

general formula (2) below.)

### General formula (2)

(where R<sup>18</sup>, R<sup>19</sup>, R<sup>20</sup>, R<sup>21</sup>, and R<sup>22</sup> are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having at least one carbon; and R<sup>16</sup> and R<sup>17</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

### General formula [III]

(where at least one of R<sup>23</sup>, R<sup>24</sup>, R<sup>25</sup>, and R<sup>26</sup> denotes an aryl group represented by the general formula (3) below, with the remainder being an unsubstituted aryl group.)

### General formula (3)

(where R<sup>29</sup>, R<sup>30</sup>, R<sup>31</sup>, R<sup>32</sup>, and R<sup>33</sup> are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon amino group; and R<sup>27</sup> and R<sup>28</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

### General formula [IV]

(where R<sup>35</sup> and R<sup>36</sup> are identical or different groups, each denoting an aryl group represented by the general formula (4) below.)

## General formula (4)

(where R<sup>40</sup>, R<sup>41</sup>, R<sup>42</sup>, R<sup>43</sup>, and R<sup>44</sup> are identical or different groups, each denoting hydrogen or at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having one or more carbons; and R<sup>34</sup> and R<sup>37</sup> are identical or different groups, at least one of them being an aryl group represented by the general formula (5) below.)

## General formula (5)

(where R<sup>45</sup>, R<sup>46</sup>, R<sup>47</sup>, R<sup>48</sup>, R<sup>49</sup>, R<sup>50</sup>, and R<sup>51</sup> are identical or different groups, each denoting a hydrogen atom or at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group, or hydrocarbon amino group having one or more carbons; and R<sup>38</sup> and R<sup>39</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

2. A bis(aminostyryl)anthracene compound represented by the general formula (6) below.

## General formula (6)

(where Ar<sup>1</sup>, Ar<sup>2</sup>, Ar<sup>3</sup>, and Ar<sup>4</sup> are identical or different, each denoting an aryl group which may have a substituent, and if a substituent is present, said aryl group being one which is selected from aryl groups represented by the general formula (7), (8), (9), (10), (11), (12), (12'), or (12'') below.

## General formula (12')

(where  $R^{52}$ ,  $R^{53}$ , and  $R^{54}$  each denotes a saturated or unsaturated hydrocarbon group having one or more carbons;  $R^{55}$ ,  $R^{56}$ ,  $R^{57}$ ,  $R^{58}$ ,  $R^{59}$ , and  $R^{60}$  are identical or different, each denoting a saturated or unsaturated hydrocarbon group having one or more carbons;  $n$  is an integer of 0 to 6;  $m$  is an integer of 0 to 3; and  $l$  is an integer of 0 to 4.)

3. A bis(aminostyryl)anthracene compound as defined in Claim 2, wherein  $R^{52}$ ,  $R^{53}$ ,  $R^{54}$ ,  $R^{55}$ ,  $R^{56}$ ,  $R^{57}$ ,  $R^{58}$ ,  $R^{59}$ , and  $R^{60}$  each has a carbon number of 1 to 6.

4. A bis(aminostyryl)anthracene compound as defined in Claim 1 or 2 which is represented by the general formula (13), (13'), (14), (15), (16), (17), (17'), or (17'') below.

## General formula (13)

(where  $R^{61}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (13')

(where  $R^{61}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (14)

(where R<sup>62</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (15)

(where R<sup>63</sup> denotes a saturated or unsaturated hydrocarbon group or hydrocarbon oxy group having 1 to 6 carbon atoms.)

## General formula (16)

(where R<sup>64</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (17)

(where R<sup>65</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (17')

(where R<sup>65</sup> denotes a hydrogen atom or a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (17'')

(where R<sup>65</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

5. A bis(aminostyryl)anthracene compound as defined in Claim 1 or 2 which is represented by the structural formula (18)-1, (18)-2, (18)-2', (18)-3, (18)-4, (18)-5, (18)-6, (18)-6', (18)-7, (18)-8, (18)-9, (18)-10, (18)-10', (18)-10'', or

(18)-11 below.

14. A process for producing a bis(aminostyryl) anthracene compound represented by the general formula [I], [II], [III], or [IV] below, said process comprising condensing at least one species of 4-(N,N-diarylamino)benzaldehyde represented by the general formula [V] or [VI] below and diphosphonic ester represented by the general formula [VII] below or diphosphonium represented by the general formula [VIII] below.

## General formula [V]

## General formula [VI]

(where  $R^{66}$  and  $R^{67}$  each denotes an aryl group corresponding to  $R^1$ ,  $R^2$ ,  $R^{12}$ ,  $R^{13}$ ,  $R^{23}$ ,  $R^{24}$ ,  $R^{34}$ , or  $R^{35}$  given below; and  $R^{68}$  and  $R^{69}$  each denotes an aryl group corresponding to  $R^3$ ,  $R^4$ ,  $R^{14}$ ,  $R^{15}$ ,  $R^{25}$ ,  $R^{26}$ ,  $R^{36}$ , or  $R^{37}$  given below.)

## General formula [VII]

## General formula [VIII]

(where  $R^{70}$  and  $R^{71}$  are identical or different, each denoting a hydrocarbon group;  $R^{72}$  and  $R^{73}$  each denotes a group corresponding to  $R^5$ ,  $R^6$ ,  $R^{16}$ ,  $R^{17}$ ,  $R^{27}$ ,  $R^{28}$ ,  $R^{38}$ , or  $R^{39}$  given below; and X denotes a halogen atom.)

## General formula [I]

(where  $R^2$  and  $R^3$  each denotes an unsubstituted aryl group, and  $R^1$  and  $R^4$  each denotes an aryl group represented by the general formula (1) below.)

### General formula (1)

(where  $R^7$ ,  $R^8$ ,  $R^9$ ,  $R^{10}$ , and  $R^{11}$  are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having one or more carbons; and  $R^5$  and  $R^6$  are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

### General formula [II]

(where  $R^{12}$ ,  $R^{13}$ ,  $R^{14}$ , and  $R^{15}$  are identical or different groups, each denoting an aryl group represented by the general formula (2) below.)

### General formula (2)

(where  $R^{18}$ ,  $R^{19}$ ,  $R^{20}$ ,  $R^{21}$ , and  $R^{22}$  are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having one or more carbons; and  $R^{16}$  and  $R^{17}$  are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

### General formula [III]

(where at least one of  $R^{23}$ ,  $R^{24}$ ,  $R^{25}$ , and  $R^{26}$  denotes an aryl group represented by the general formula (3) below,

with the remainder being an unsubstituted aryl group.)

### General formula (3)

(where R<sup>29</sup>, R<sup>30</sup>, R<sup>31</sup>, R<sup>32</sup>, and R<sup>33</sup> are identical or different groups, at least one of them being a saturated or unsaturated hydrocarbon amino group; and R<sup>27</sup> and R<sup>28</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

### General formula [IV]

(where R<sup>35</sup> and R<sup>36</sup> are identical or different groups, each denoting an aryl group represented by the general formula (4) below.)

### General formula (4)

(where R<sup>40</sup>, R<sup>41</sup>, R<sup>42</sup>, R<sup>43</sup>, and R<sup>44</sup> are identical or different groups, each denoting hydrogen or at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group having one or more carbons; and R<sup>34</sup> and R<sup>37</sup> are identical or different groups, being an aryl group represented by the general formula (5) below.)

### General formula (5)

(where R<sup>45</sup>, R<sup>46</sup>, R<sup>47</sup>, R<sup>48</sup>, R<sup>49</sup>, R<sup>50</sup>, and R<sup>51</sup> are identical or different groups, each denoting a hydrogen atom or at least one of them being a saturated or unsaturated hydrocarbon oxy group or hydrocarbon group, or hydrocarbon amino group having one or more carbons; and R<sup>38</sup> and R<sup>39</sup> are identical or different groups, at least one of them being a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

15. A process for producing a bis(aminostyryl) anthracene compound as defined in Claim 14, wherein said condensation is accomplished by Wittig-Horner reaction or Wittig reaction, which involves treating the diphosphonic ester and/or diphosponium with a base in a solvent, thereby giving carboanion, and condensing this carboanion with the 4-(N,N-diarylamino)benzaldehyde.

16. A process for producing a bis(aminostyryl) anthracene compound as defined in Claim 14, wherein said bis(aminostyryl) anthracene is represented by the general formula (6) below.

**General formula (6)**

(where Ar<sup>1</sup>, Ar<sup>2</sup>, Ar<sup>3</sup>, and Ar<sup>4</sup> are identical or different, each denoting an aryl group which may have a substituent, and if a substituent is present, said aryl group being one which is selected from aryl groups represented by the general formula (7), (8), (9), (10), (11), (12), (12'), or (12'') below.

## General formula (38)

(where Ar<sup>1</sup>, Ar<sup>2</sup>, Ar<sup>3</sup>, Ar<sup>4</sup>, R<sup>70</sup>, R<sup>71</sup> and X are defined as above.)

22. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 21, wherein R<sup>70</sup> and R<sup>71</sup> each denotes a saturated hydrocarbon group having 1 to 4 carbon atoms.

23. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 21, wherein R<sup>52</sup>, R<sup>53</sup>, R<sup>54</sup>, R<sup>55</sup>, R<sup>56</sup>, R<sup>57</sup>, R<sup>58</sup>, R<sup>59</sup>, and R<sup>60</sup> each has 0 to 6 carbon atoms.

24. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 14 or 21, said process yielding a bis(aminostyryl)anthracene compound represented by the general formula (20), (21), (22), (23), (24), (24') or (24'') below.

General formula (20)

(where R<sup>61</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (21)

(where R<sup>62</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (22)

(where R<sup>63</sup> denotes a saturated or unsaturated hydrocarbon group or hydrocarbon oxy group having 1 to 6 carbon atoms.)

General formula (23)

(where R<sup>64</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (24)

(where R<sup>65</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (24')

(where R<sup>65</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (24")

(where R<sup>65</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

25. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 14 or 21, said process yielding a bis(aminostyryl)anthracene compound represented by the structural formula (25)-1, (25)-2, (25)-2', (25)-3, (25)-4, (25)-5, (25)-6, (25)-6', (25)-7, (25)-8, (25)-9, (25)-10, (25)-10', (25)-10'', or (25)-11 below.

26. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 14, wherein said bis(aminostyryl)anthracene is represented by the general formula (26) below.

General formula (26)

(where Ar¹, Ar², Ar³, and Ar⁴ are identical or different, each denoting an aryl group which may have a substituent, and if a substituent is present, said aryl group being one which is selected from aryl groups represented by the general formula (7), (8), (9), (10), (11), (12), (12'), or (12'') below.

General formula (7)

General formula (8)

General formula (12)

General formula (12')

General formula (12'')

(where  $R^{52}$ ,  $R^{53}$ , and  $R^{54}$  each denotes a saturated or unsaturated hydrocarbon group having one or more carbons;  $R^{55}$ ,  $R^{56}$ ,  $R^{57}$ ,  $R^{58}$ ,  $R^{59}$ , and  $R^{60}$  are identical or different, each denoting a saturated or unsaturated hydrocarbon group having one or more carbons;  $n$  is an integer of 0 to 6;  $m$  is an integer of 0 to 3; and  $l$  is an integer of 0 to 4.)

said process comprising condensing at least one species of 4-(N,N-diarylamino)benzaldehyde represented by the general formula (33) or (34) below with diphosphonic ester represented by the general formula (39) below or diphosponium represented by the general formula (40) below.

## General formula (33)

## General formula (34)

## General formula (39)

## General formula (40)

(where Ar<sup>1</sup>, Ar<sup>2</sup>, Ar<sup>3</sup>, Ar<sup>4</sup>, R<sup>70</sup>, R<sup>71</sup> and X are defined as above.)

27. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 26, wherein R<sup>70</sup> and R<sup>71</sup> each denotes a saturated hydrocarbon group having 1 to 4 carbon atoms.

28. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 26, wherein R<sup>52</sup>, R<sup>53</sup>, R<sup>54</sup>, R<sup>55</sup>, R<sup>56</sup>, R<sup>57</sup>, R<sup>58</sup>, R<sup>59</sup>, and R<sup>60</sup> each has 1 to 6 carbon atoms.

29. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 14 or 26, said process yielding a bis(aminostyryl)anthracene compound represented by the general formula (27), (28), (29), (30), (31), (31') or (31'') below.

General formula (27)

(where  $R^{61}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (28)

(where  $R^{62}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (29)

(where  $R^{63}$  denotes a saturated or unsaturated hydrocarbon group or hydrocarbon oxy group having 1 to 6 carbon atoms.)

## General formula (30)

(where  $R^{64}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (31)

(where  $R^{65}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

## General formula (31')

(where  $R^{65}$  denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

General formula (31")

(where R<sup>65</sup> denotes a saturated or unsaturated hydrocarbon group having 1 to 6 carbon atoms.)

30. A process for producing a bis(aminostyryl)anthracene compound as defined in Claim 14 or 26, said process yielding a bis(aminostyryl)anthracene compound represented by the structural formula (32)-1, (32)-2, (32)-2', (32)-3, (32)-4, (32)-5, (32)-6, (32)-6', (32)-7, (32)-8, (32)-9, (32)-10, (32)-10', or (32)-10'' below.

Structural formula (32)-10

Structural formula (35)-10'

## Structural formula (32)-10"

31. A diphosphonic ester or diphosphonium represented by the general formula [VII] or [VIII] below.

## General formula [VII]

## General formula [VIII]

(where  $R^{70}$  and  $R^{71}$  are identical or different, each denoting a hydrocarbon group;  $R^{72}$  and  $R^{73}$  are identical or different, at least one of them denoting a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom, and X denotes a halogen atom.)

32. A diphosphonic ester or diphosphonium as defined in Claim 31, wherein  $R^{70}$  and  $R^{71}$  each denotes a saturated hydrocarbon group having 1 to 4 carbon atoms.

33. A diphosphonic ester or diphosphonium as defined in Claim 31, which is represented by the general formula (35) or (36) below.

## General formula (35)

## General formula (36)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and X are defined as above.)

34. A diphosphonic ester or diposphonium as defined in Claim 31, which is represented by the general formula (37) or (38) below.

## General formula (37)

## General formula (38)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and X are defined as above.)

35. A diphosphonic ester or diposphonium as defined in Claim 31, which is represented by the general formula (39) or (40) below.

## General formula (39)

## General formula (40)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and X are defined as above.)

36. A process for producing a diphosphonic ester or diphosphonium represented by the general formula [VII] or [VIII] below, said process comprising reacting an aryl halide compound represented by the general formula [IX] below and a trialkyl phosphite represented by the general formula [X] below or triphenyl phosphine ( $\text{PPh}_3$ ).

## General formula [IX]

(where  $\text{R}^{72}$  and  $\text{R}^{73}$  are identical or different, at least one of them denoting a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom, and X denotes a halogen atom.)

General formula [X]

(where  $\text{R}^{74}$  and  $\text{R}^{75}$  are identical or different, each denoting a hydrocarbon group.)

## General formula [VII]

## General formula [VIII]

(where  $\text{R}^{70}$  and  $\text{R}^{71}$  are identical or different, each denoting a hydrocarbon group; and  $\text{R}^{72}$ ,  $\text{R}^{73}$ , and  $\text{X}$  are defined as above.)

37. A process for producing a diphosphonic ester or diphosponium as defined in Claim 36, wherein  $\text{R}^{70}$  and  $\text{R}^{71}$  each denotes a saturated hydrocarbon group having 1 to 4 carbon atoms.

38. A process for producing a diphosphonic ester or diphosponium as defined in Claim 36, said process yielding a diphosphonic ester or diphosponium represented by the general formula (35) or (36).

## General formula (35)

## General formula (36)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and  $\text{X}$  are defined as above.)

39. A process for producing a diphosphonic ester or diphosponium as defined in Claim 36, said process yielding a diphosphonic ester or diphosponium represented by the general formula (37) or (38).

General formula (37)

General formula (38)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and X are defined as above.)

40. A process for producing a diphosphonic ester or diphosphonium as defined in Claim 36, said process yielding a diphosphonic ester or diphosphonium represented by the general formula (39) or (40).

General formula (39)

General formula (40)

(where  $\text{R}^{70}$ ,  $\text{R}^{71}$ , and X are defined as above.)

41. An aryl halide compound represented by the general formula [IX] below.

General formula [IX]

(where  $R^{72}$  and  $R^{73}$  are identical or different, at least one of them denoting a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

42. A process for producing an aryl halide compound represented by the general formula [IX] below, said process comprising reacting an anthracene compound represented by the general formula [XI] below with an N-halogenated succinimide represented by the general formula [XII] below.

General formula [XI]

(where  $R^{72}$  and  $R^{73}$  are identical or different, at least one of them denoting a hydrogen atom, cyano group, nitro group, trifluoromethyl group, or halogen atom.)

General formula [XII]

(where X denotes a halogen atom.)

General formula [IX]

(where  $R^{72}$  and  $R^{73}$  are defined as above, and X denotes a halogen atom.)
